2. Even though there's no interface, ZIPZipper is very easy to handle and it only takes a few seconds to create a ZIP archive. On the downside, it's slow when handling large archives and it seems it's written in pure Java, so it doesn't scale well when the number of files gets larger.

In addition, you can rename the file by modifying its name, add a description, change the icon, and so on. In the same way you can modify the properties of the shortcut by using the icon tool or by tweaking its name, description, icon and other parameters. When creating a shortcut, the software can choose a folder or a directory, create a ZIP archive containing the
